

Security Solutions that Work

While there are many options and services offered by ISS's Customer Monitoring Centers, basic monitoring combines an elegant simplicity with advanced technology and the responsiveness of trained, concerned employees.

1. Communication with ISS begins when a sensor or contact detects an intruder, fire, or other change and activates an alarm.
2. The keypad sends a signal to the main panel.
3. The main panel seizes the phone line and dials the ISS monitoring center, known as the Customer Monitoring Center.
4. An ISS operator then contacts the customer and/or the proper authorities.

A single ISS system helps protect your home/office from burglary, fire, carbon monoxide, medical emergencies and more, 24 hours a day.

How ISS Monitoring Works
